

ArthroSphere V1 by ArthroPods

The ArthroSphere V1 is suitable for all microscopes that allow a high working distance, the average height of the ArthroSphere + specimen on a 40mm pin is 60mm. A low profile version of the ArthroSphere will be available soon.

Mounting the specimen laterally with the pin inserted across the plastizote plug can reduce the distance moved when rotating from dorsal to lateral viewing and hence limit the refocusing require for different views.

The foam plug supplied is half split to facilitate inverted mounting of specimens for ease of observing ventral characters.

Using a razor to make this split in user cut plugs will create an ideal split width..
